EDUCATION University of Washington

Seattle, WA

Ph.D. in Computer Science and Engineering Advisors: Hank Levy and Arvind Krishnamurthy

University of Washington

Seattle, WA

M.S. in Computer Science and Engineering

December 2013

Advisors: Hank Levy, Arvind Krishnamurthy, and Steve Gribble Thesis: Simplifying Mobile/Cloud Applications with Sapphire

Massachusetts Institute of Technology

Cambridge, MA

M.Eng. in Electrical Engineering and Computer Science

June 2009

Advisor: M. Frans Kaashoek

Thesis: Efficient File Distribution in a Flexible, Wide-area File System

Massachusetts Institute of Technology S.B. in Computer Science and Engineering

Cambridge, MA

June 2008

Interests

Operating systems, distributed systems, virtualization and networking

Research

Building Consistent Transactions with Inconsistent Replication

TAPIR – the Transactional Application Protocol for Inconsistent Replication – provides externally consistent transactions using a replication protocol with *no consistency guarantees*. Unlike conventional protocols that use Paxos, TAPIR does not require a Paxos leader or coordination between replicas in a shard. Thus, TAPIR can commit a transaction *in a single round-trip* and eliminate the bottleneck at the Paxos leader.

Customizable and Extensible Deployment for Mobile/Cloud Applications

Sapphire is a new distributed programming platform providing customizable and extensible deployment of mobile/cloud applications. The key concept is an architecture that supports deployment managers, which solve complex distributed systems tasks, such as code-offloading and caching. Rather than writing distributed systems code, programmers compose a custom deployment to meet their application's needs.

User-controlled Privacy for Mobile/Cloud Applications

Agate is a new trusted distributed runtime system that gives users control over how mobile/cloud applications share sensitive user data collected on mobile devices (e.g., photos, GPS location). Agate combines aspects of access control and information flow control to allow applications to share user data in application-specific ways, while enforcing user policies without trusting the application or the application programmer.

Arrakis: The Operating System is the Control Plane

Arrakis is a new operating system that provides high performance I/O by taking advantage of hardware virtualization technology. Hardware virtualization technologies are designed to eliminate the hypervisor from fast-path I/O operations. Arrakis takes this technology a step further by using it to eliminate the operating system as well, allowing applications to directly access the hardware during normal execution and providing significantly better performance, reliability and customizability.

Improving VM Checkpoint Restore Performance

With collaborators at VMware, I developed two techniques for improving the performance of restoring checkpointed virtual machines. The first estimates and prefetches the working set of the checkpointed VM on restore, improving the responsiveness of the VM during restore. The second groups memory pages together on disk that are likely to be accessed together, improving disk efficiency during restore.
